Secretary

**David H. Mulligan**  
Commissioner

To the Honorable Senate and  
House of Representatives:

We have the honor to submit as required by Chapter 111, Section 2 of the General Laws, the one hundred forty-sixth annual report on statistics of births, deaths, fetal deaths, marriages and divorces, in Massachusetts for the calendar year 1987.

This is the twenty-fourth Annual Report of Vital Statistics published by the Department of Public Health and is intended to assist in the development of policy and programmatic initiatives within the Department, as well as to provide State officials and agencies, and the general public, with valuable statistical information.

Sincerely,

A handwritten signature in cursive script, reading "David H. Mulligan".

David H. Mulligan  
Commissioner

## ACKNOWLEDGEMENTS

This publication of the **1987 ANNUAL REPORT OF VITAL STATISTICS** is the result of the combined efforts of the following data providers. We gratefully acknowledge the assistance provided by the 351 city and town clerks, hospital personnel, physicians, funeral directors, probate courts, clinics, and Department of Public Health personnel, without whose efforts there would be no vital statistics.

Department of Public Health staff most significantly involved in the production of the **1987 ANNUAL REPORT OF VITAL STATISTICS** include:

Robert A. Danley, population statistics;

Joan L. Gancarski, Bureau of Health Statistics, Research and Evaluation: assistance and technical data from Advance Data: Births 1987 and Advance Data: Deaths 1987;

Michael Healey, Division of Data Processing: data file management and vital events series printouts;

Lynne Steinman, Public Information and Data Management: supervision of computer graphics and special table production, with programming by Greg Hanna, Ralph Marple, Duke Rhoden, Robert S. Woodburn, and Charlene Zion;

Dennis Sterzin and Roger Davenport, Department of Public Health Graphic Arts Unit: graphics layout and assistance;

Phyllis Zeuli, Assistant Registrar for Statistics: supervision of data collection, coding and editing, with technical assistance from Lisa Varnerin (Statistics Unit Supervisor) and Robert Coffin (Chief Nosologist).

The joint efforts of all the staff of the Registry of Vital Records and Statistics are necessary to produce the data contained in this publication. Special acknowledgement is made to the following Registry supervisors:

Karin Barrett, Data Quality Assurance Coordinator, who oversees the hospital query program for birth certificate data and provides assistance in developing specialized table production;

Alan Goldin, Director of Automation, who is responsible for the installation and supervision of the Automated Vital Statistics System (AVSS) and all computer-based systems in the Registry office;

Harold Leonard, Supervisor of the Records Unit, which is responsible for maintaining all records and issuing certified copies;

James Orseno, Supervisor of the Operations Unit, which is responsible for all printing and mailing of forms;

Phyllis Rotman, Supervisor of the Registration Unit, which is responsible for coordination with cities and towns to produce the data in a timely fashion.

The **1987 ANNUAL REPORT OF VITAL STATISTICS** has been compiled and produced under the general supervision and direction of:

Howard Spivak, M.D., Deputy Commissioner, Health Promotion Sciences;  
Daniel J. Friedman, Ph.D., Asst. Commissioner, Bureau of Health Statistics, Research and Evaluation;  
Bruce B. Cohen, Ph.D., Director, Research and Epidemiology;  
Victoria Vespe Ozonoff, Ph.D., Director, Health Resources Statistics;  
Lynne Steinman, Unit Coordinator, Public Information and Data Management;  
Elaine B. Trudeau, Registrar, Vital Records and Statistics.

  
Elaine B. Trudeau, Registrar  
Editor

## INTRODUCTION

The *Annual Report of Vital Statistics* (Public Document No. 1) has been continuously published since 1842. This is the 24th edition produced by the Department of Public Health. This report, required under the provisions of Section 2, Chapter 111 of the Massachusetts General Laws, tabulates data on Massachusetts births, fetal deaths, deaths, marriages, divorces, and population for calendar year 1987. Approximately 2,000 copies of the report are distributed to federal, state, and local governmental agencies, private and public health planners and researchers, students, and members of the general public. The report provides its users with an overview of the health status of the Massachusetts population.

Vital statistics data may be tabulated either in terms of residence or occurrence. Residence data include all events which occur to residents of the Commonwealth wherever they occur. Occurrence data include all those events which occur within the state, including those which occur to out-of-state residents. There is an interstate exchange of copies of birth, death and fetal death records among the fifty states, the District of Columbia, Puerto Rico, the Virgin Islands, Guam, and all Canadian provinces. These records are exchanged for statistical purposes only, for events which occur in states other than where the individual resides; this allows each of the states and provinces to track the births and deaths of their residents. The majority of the data presented in this report for births and deaths is based on residence data. Marriage and divorce data, however, only reflect events which occurred within the Commonwealth.

## REGISTRATION

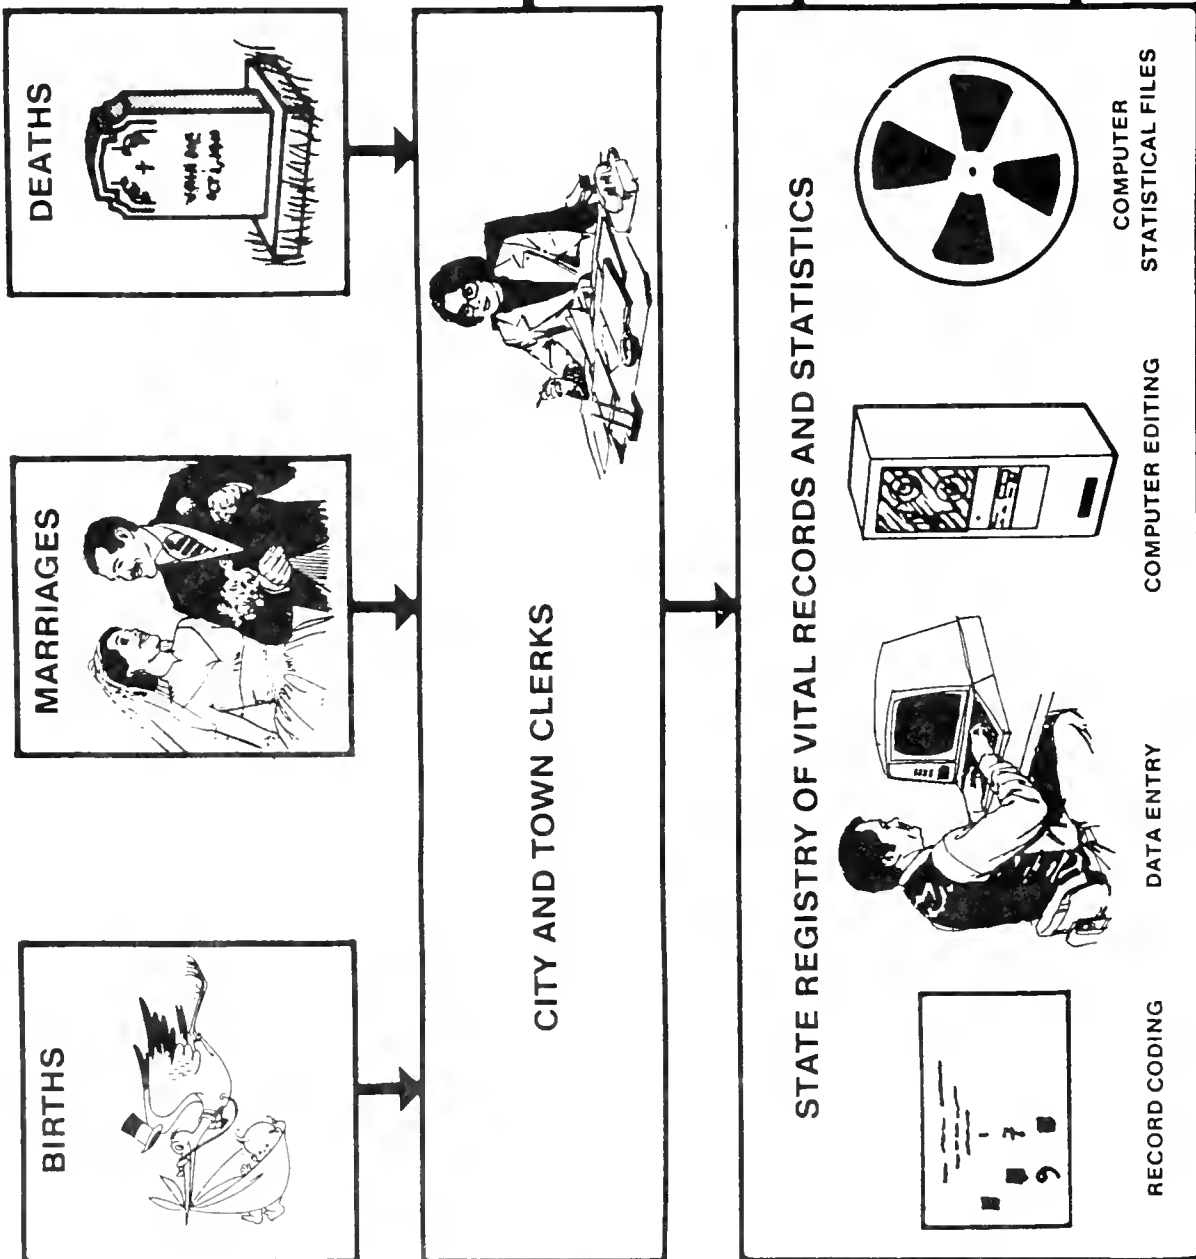

The first government-operated system of vital events registration anywhere in the world began in the Commonwealth of Massachusetts in 1639 under colonial administration. Prior to that time, in countries such as England with a vital registration system, the responsibility for the registration of vital events had been placed on church officials. The Massachusetts system mandated the registration of vital events by the clerks of the communities. In 1841, the Massachusetts legislature established the first statewide coordination for the registration of these events by requiring that copies of the events registered in the local cities and towns be sent to the Secretary of State. In 1976, the responsibility for the state coordination was transferred to the Department of Public Health. This was accomplished to rejoin the statistical and registration functions which had been separated by the 1964 transfer of the statistical function to the Department of Public Health. With the exception of the administrative location of the State Registry, the actual mechanics of the system have changed remarkably little over the years.

With limited exceptions, most vital records in Massachusetts are open, public records. The figure on the next page illustrates the registration process in Massachusetts. For open birth and death records, there is a triple registration process in Massachusetts. The

# The Vital Records and Statistics Process

PRODUCT

PROCESS

event is first recorded in the city or town where the event occurred. The clerk of that community is then required to forward a certified copy of the record to the community where the person resided at the time of the event and a copy to the State Registry. Certified copies of the records may be issued from local or state records. If the record is a restricted record, such as those of out-of-wedlock births, the registration occurs only in the community where the event occurred and the state office.

In addition to receiving a legal copy of each birth record from the city or town in which the birth occurred, the State Registry also receives a confidential copy of the birth record directly from the hospital or birth center where the birth occurred. This copy includes confidential medical information in addition to the legal information. It is this copy of the record which is processed to produce the statistical information on births contained in this report.

Since 1986 the State Registry has developed a program of direct electronic transmission of birth records from hospitals. The system used in Massachusetts is called the Automated Vital Statistics System (AVSS). It was developed at the University of California, Santa Barbara. More than 50% of all birth records are now received through this method. AVSS has contributed to reducing processing time at both the hospital level and the State Registry, while the built-in edits of the system increase the quality of the data.

Anyone wishing to be married in the Commonwealth may receive their license from any of the 351 cities or towns in the state regardless of where they reside or where the marriage is to take place in the Commonwealth. The community issuing the license is required to send an attested copy of the marriage record to the State Registry.

The Registry of Vital Records and Statistics receives directly from hospitals or physicians the reports of fetal deaths of either twenty or more weeks gestation or a weight of at least 350 grams. There are no local filings of fetal death reports. Abstracts of divorces granted are also sent directly to the State Registry from the Registers of Probate from each county probate court.

### ***STATISTICAL PROCESSING AND TABULATING***

The records received in the State Registry are carefully examined for legal errors and inconsistencies. As part of the computerization process, significant computer editing is also done. A computerized hospital query program is part of the AVSS program. The Registry also has a data quality assurance program that includes on-site visits to clerks and hospitals that have difficulties in reporting and training to all groups involved in the data collection process.

Annually, when registration is considered as complete as possible, statistics are aggregated for presentation in this report, special studies, and program monitoring and surveillance.

Anyone using statistical information for comparisons over time should be aware of inconsistencies and changing conventions for classification and coding. This is particularly important when using cause of death information. Codes used for classifying cause of death in this report are based on the Ninth Revision of the International Classification of Diseases, World Health Organization. Classification of variables such as race, nativity, and marital status may also differ over time.

It is hoped that this report will be useful to a wide range of health data users in the Commonwealth, as well as educational planners, demographers, and historians. Questions concerning these data and requests for more detailed findings should be directed to:

# VITAL EVENTS

## **SECTION A**

### **VITAL EVENTS**

#### **HIGHLIGHTS**

##### **LIVE BIRTHS**

- In 1987, there were 84,343 live births to Massachusetts residents.
- Live births increased by 2.6% from 1986 to 1987.
- The 1987 live birth rate in Massachusetts per 1,000 population increased from 14.1 in 1986 to 14.4 in 1987.
- Massachusetts' 1987 live birth rate of 14.4 per 1,000 population remains below the 1987 U.S. rate of 15.7.
- The largest number of births occurred in July (9.0%--7,569), and the fewest occurred in February (7.1%--5,989).

##### **DEATHS**

- In 1987, 55,562 Massachusetts residents died.
- The number of deaths decreased by 0.5% from 1986 to 1987.
- The rate of deaths per 1,000 population also decreased from 9.6 in 1986 to 9.5 in 1987.
- The U.S. death rate remained constant in 1987 at 8.7. (Differences between the crude death rates in Massachusetts and the U.S. may reflect differences in the age distribution of the population.)
- The largest number of deaths occurred in January (9.1%--5,036), and the fewest occurred in September (7.6%--4,212).

##### **FETAL DEATHS**

- There were 498 reportable fetal deaths to Massachusetts residents in 1987.
- Reportable fetal deaths decreased by 13.2% from 1986 to 1987, resulting in a fetal death rate of 5.9 per 1,000 live births and fetal deaths.

##### **INFANT DEATHS**

- In 1987, 608 infant deaths (those less than 1 year) occurred to Massachusetts residents.
- The Massachusetts infant mortality rate decreased from 8.4 deaths per 1,000 live births in 1986 to 7.2 deaths in 1987.
- In 1987, the black infant mortality rate decreased from 19.7 in 1986 to 15.5 in 1987.
- The Massachusetts 1987 infant mortality rate of 7.2 per 1,000 live births was 29 percent below the U.S. rate of 10.1.

## **MARRIAGES**

- In 1987, 49,034 marriages took place in Massachusetts.
- The number of marriages decreased by 1.9% from 1986 to 1987. Nationally, the number of marriages increased by 0.9% during the same period.
- The 1987 Massachusetts rate of 8.4 marriages per 1,000 population was below the U.S. rate of 9.9.
- For the first time in many years, June was replaced as the favorite month for marriages. The largest number of marriages occurred in October with 6,169 (12.6%), and the fewest occurred in January (1,663--3.4%).

## **DIVORCES**

- In 1987, 16,994 divorces were granted in Massachusetts.
- Divorces in Massachusetts decreased by 14.2% from 1986 to 1987.
- The 1987 Massachusetts divorce rate of 2.9 divorces per 1,000 population was below the U. S. rate of 4.8.
- The largest number of divorces were finalized in July with 1,564 (9.2%), and the fewest in May (1,144--6.7%).

## **NATURAL INCREASE**

- The rate of natural increase in Massachusetts reflected an increase to 4.9 per 1,000 residents in 1987 from a rate of 4.5 in 1986.
- The 1987 U.S. rate of natural increase of 7.0 remains far above that of Massachusetts.

The Vital Events section provides basic information on all vital events. In addition to the information highlighted above, this section contains summary birth and death data by city, town, and county. More detailed information is contained in the sections on the individual events.

## **DEFINITIONS AND RATES IMPORTANT FOR THIS SECTION INCLUDE**

<b>OCCURRENCE</b>	Occurrence data reflect where the event took place without regard to residence. In Massachusetts, place will be one of 351 cities or towns.
<b>RESIDENCE</b>	The usual place of residence as reported by the mother (for births) or the informant (for deaths). An infant's residence is considered that of the mother. While occurrence data include only events that occurred within Massachusetts, residence data for births and deaths include those which may or may not have occurred within Massachusetts.
<b>NATURAL INCREASE</b>	The difference between the number of resident live births and the number of resident deaths.

## CRUDE RATES OF VITAL EVENTS

$$\text{BIRTH RATE} = \frac{\text{No. of Resident Live Births}}{\text{Total Population}} \times 1,000$$

$$\text{FETAL MORTALITY} = \frac{\text{No. of Resident Fetal Deaths}}{\text{Resident Live Births} + \text{Resident Fetal Deaths}} \times 1,000$$

$$\text{INFANT MORTALITY} = \frac{\text{No. of Resident Deaths LT 1 Year}}{\text{Resident Live Births}} \times 1,000$$

$$\text{NEONATAL MORTALITY} = \frac{\text{No. of Resident Deaths LT 28 Days}}{\text{Resident Live Births}} \times 1,000$$

$$\text{DEATH RATE} = \frac{\text{No. of Resident Deaths}}{\text{Total Population}} \times 1,000$$

$$\text{MARRIAGE RATE} = \frac{\text{No. of Occurrence Marriages}}{\text{Total Population}} \times 1,000$$

$$\text{DIVORCE RATE} = \frac{\text{No. of Occurrence Divorces}}{\text{Total Population}} \times 1,000$$

**TABLE A-1  
SELECTED RECORDS IN VITAL STATISTICS  
MASSACHUSETTS  
1987**

**NATALITY**

Ages of Mothers: 12-48

Ages of Fathers: 14-81

Sets of Twins: 940

Sets of Triplets: 12

Most Births Occurred: October 23, 1987 (300 births)

Fewest Births Occurred: August 23, 1987 (155 births)

Highest # of Births at: Brigham and Women's Hospital (9,996 births)

Lowest # of Births at: Fairview Hospital (75 births)

**Ten Most Popular Names For Babies**

<i>Boys' Names</i>	<i>Number</i>	<i>Girls' Names</i>	<i>Number</i>
Michael	2,214	Jessica	1,221
Matthew	1,510	Ashley	1,186
Christopher	1,440	Amanda	1,175
Daniel	1,138	Jennifer	892
David	995	Nicole	715
Andrew	981	Sarah	709
John	941	Elizabeth	581
Joseph	841	Stephanie	570
Ryan	809	Danielle	504
James	800	Samantha	498

**MORTALITY**

Male Decedents 100 Years and Older: 66

Female Decedents 100 Years and Older: 295

Most Deaths Occurred: May 31, 1987 (190 deaths)

Fewest Deaths Occurred: September 2, 1987 (108 deaths)

Most Suicides Occurred: September (62)

Most Homicides Occurred: September and December (20 each)

Most Motor Vehicle Deaths Occurred: August (84)

Weekday Most Deaths Occurred: Friday (8,053 deaths)

Weekday Fewest Deaths Occurred: Thursday (7,779 deaths)

**MARRIAGE**

Ages of Brides: 14-88

Ages of Grooms: 15-93

Most Popular Month for Marriages: October (6,169 marriages)

Least Popular Month for Marriages: January (1,663 marriages)

Greatest Age Difference When Bride older than Groom: 31 years

Greatest Age Difference When Groom older than Bride: 56 years

**DIVORCE**

Length of Marriages Involved in Divorces: <1 Year to 55 Years of Marriage    Most Common Length of Marriage Prior to Divorce: 3 Years

Month Most Divorces Granted: July (1,564 divorces)

Month Fewest Divorces Granted: May (1,144 divorces)

NOTES: Neonatal and infant deaths are included in total deaths; fetal deaths are excluded from total deaths. Figures for marriages and divorces reflect occurrence, not residence.

The rates for live births, total deaths, marriages and divorces are per 1,000 population.

Rates for infant and neonatal deaths are per 1,000 live births.

Rates for fetal deaths are per 1,000 live births and fetal deaths.

\* =Revised

\*\*=provisional

# NATALITY

## SECTION B

### NATALITY

A ten-year trend of increased births to Massachusetts residents continued in 1987. There were 84,343 live births to Massachusetts residents in 1987, a 2.6% increase over the 82,163 resident live births in 1986. Live births to Massachusetts residents include all births to Massachusetts residents, regardless of the state in which they occurred. Most data presented in this section are resident data. Table B-10 presents births by hospital of occurrence.

#### OCCURRENCE BIRTHS

In 1987, 86,233 births occurred in Massachusetts. All but 596 births occurred at the 58 hospitals with maternity units. The number of babies delivered at these hospitals ranged from 75 at Fairview Hospital in Great Barrington to 9,996 at Brigham and Women's Hospital in Boston. The median number of births per hospital was 1,098, a slight increase from the median number of 1,090 in 1986. The four hospitals with the largest number of births -- Brigham and Women's (9,996), Bay State Medical Center (5,864), Beth Israel (4,394) and St. Margaret's (3,381) represent slightly more than 28% of all births occurring in Massachusetts. The distribution of Massachusetts births by hospital size is presented below. These data have shown little change in the past several years.

#### 1987 DISTRIBUTION OF MASSACHUSETTS OCCURRENCE BIRTHS

NUMBER OF BIRTHS	NO. OF HOSPITALS IN CATEGORY	TOTAL NO. OF BIRTHS IN CATEGORY	% OF TOTAL BIRTH
<500	10	2,713	3.1
500-999	16	12,225	14.2
1000-1499	13	15,612	18.1
1500-1999	8	14,283	16.6
≥2000	11	40,804	47.3
ALL OTHER*	—	<u>596</u>	<u>0.7</u>
TOTAL	58	86,233	100.0

\*Includes all other hospitals, birthing centers, home births, and births occurring en route to a hospital.

#### HOME BIRTHS

What appears to be a growing public interest in home births is not reflected in the reported numbers: only 0.4% of births occurred at home. However, home births may be under-counted in the data presented. Home births, much more than hospital births, tend to be recorded as delayed records rather than reported at the time of birth. Delayed records are not included in these numbers.

#### BIRTHS BY RACE

The number of births by race of infant remained relatively constant, with over 79% of the births to Massachusetts residents being white. There are a number of points to keep in mind when analyzing 1987 data by race. Most important, 1987 was the first year in which the new birth certificate was utilized for

the entire year. However, 1.1% of the certificates received had no information on race. Another major problem occurred with the lack of precise data on Massachusetts' Hispanic population prior to June, 1986. The question as asked on the January-May 1986 birth certificate was limited to a race question. In many cases, individuals with an Hispanic ethnicity selected a race code rather than responding as Hispanic. If the response was Hispanic, however, these births were formerly included in the larger category of "white". The new birth certificate, introduced in June 1986, collects information on both race and ethnicity and provides improved data on Hispanics. Presented below are data for calendar year 1987 utilizing maternal race and ethnicity information:

**RACE AND ETHNICITY OF MOTHER  
JANUARY - DECEMBER, 1987**

<b>MATERNAL RACE/ETHNICITY</b>	<b>TOTAL BIRTHS</b>	<b>% OF TOTAL</b>
White non-Hispanic	69,053	81.9
Black non-Hispanic	6,034	7.2
Hispanic	5,623	6.7
Asian	2,498	3.0
Other	159	0.2
Unknown	<u>976</u>	<u>1.2</u>
<b>TOTAL</b>	<b>84,343</b>	<b>100.0*</b>

\*Percent does not sum to 100.0 due to rounding.

The final point which must be considered is the method used to present data by race. On the birth certificate, information is collected on mother's race and father's race. From these two items, a race for the infant is generated using standards set by the National Center for Health Statistics.

Depending on the use of the data, race data may be presented by race of infant or race of mother. If, for example, access to prenatal care is being analyzed, the information may be better presented by race of mother rather than race of infant. Although the differences in the numbers when comparing race of mother to race of infant are not substantial, the impact on rates may be significant because of the relatively small percentage of births to non-whites in Massachusetts.

On a birth certificate, if the race of one parent is unknown, the child is automatically assigned to the race of the parent whose race is known. On a death certificate, only the race of the infant is provided; therefore, using the race of mother generated from birth certificate data for the denominator will not provide consistent data. If, however, infant mortality rates are computed by race, the race of the infant must be used to provide consistent data.

## **TEEN BIRTHS**

The number of births to mothers between the ages of 15 and 19 increased from 6,754 births in 1986 to 6,923 births in 1987. However, the percent of teen births remained constant at 8.3%. The age-specific birth rate increased slightly from 30.1 to 32.0, because the population of females 15 to 19 years old decreased, thus decreasing the denominator of the rate.

## BIRTHS BY MARITAL STATUS

The proportion of unmarried mothers continued to increase to 20.8% of total births. More than 77.0% of the births to women under the age of 20 were out-of-wedlock births. Births to women under the age of 20 represent 8.3% of total births, but almost 31.0% of the births to unmarried mothers.

## BIRTHS BY AGE OF MOTHER

The actual numeric increases in births between the years 1986 and 1987 have been to older mothers as demonstrated below:

AGE OF MOTHER	DIFFERENCE IN BIRTHS 1986-1987	% CHANGE
<20	+168	+2.4
20-24	-213	-1.1
25-29	+214	+0.8
30-34	+1,215	+5.8
35-39	+573	+8.4
40-44	+246	+29.0
>44	-24	-42.1

## BIRTHS BY C-SECTION

The number of Caesarean section deliveries to Massachusetts residents continued to rise from 19,129 (revised) in 1986 to 19,918 in 1987. The rate per 1,000 live births also increased from 232.8 (revised) to 236.2. The lowest rate of C-sections (when the mother's age is known) was for mothers under the age of 15 (145.8 per 1,000 live births), and the highest was for women aged 40-44 (339.4). An important trend, however, is the increase to 259.2 in 1987 from 243.1 C-sections per 1,000 live births in 1986 for women aged 30-34.

## HOSPITAL PROFILES

The following is a synopsis of the data presented in Table B-10, Hospital Profiles, Massachusetts Occurrence Births:

**\*\*The percentage of Caesarean sections per hospital ranged from 14.8% to 35.8% of total births.**

**\*\*The highest percentage of low birthweight babies were born at St. Margaret's Hospital in Boston (14.2%), the lowest percentage at Providence Hospital in Holyoke (2.1%).**

**\*\*When comparing low birthweight infants by race per hospital, the ranges were: 1.8% to 18.7% white non-Hispanic; 2.6% to 20.5% black non-Hispanic; 1.9% to 14.3% Hispanic; and 2.4% to 18.7% Asian.**

**\*\*Based on total occurrence births, adequate prenatal care received by mothers per hospital ranged from 31.0% to 95.0%. When comparing prenatal care by race per hospital, white non-Hispanic mothers received 33.6% to 95.2% adequate care; black non-Hispanic mothers received 25.0% to 97.1% adequate care; Hispanic mothers received 21.7% to 92.1% adequate care; and Asian mothers received 18.2% to 100.0% adequate care.**

**\*\*The highest percent of mothers who breast fed their babies occurred at suburban hospitals: 77.1% of black non-Hispanic mothers at Newton-Wellesley Hospital in Newton to 92.3% of Hispanic mothers in Melrose-Wakefield Hospital in Melrose. The lowest percentages of breastfeeding mothers occurred at urban hospitals: 4.5% of Asian mothers in Charlton Memorial Hospital in Fall River to 25.5% of Hispanic mothers in St. Luke's Hospital in New Bedford.**

**\*\*The source of payment for delivery by private insurers (Blue Cross/Blue Shield, Health Maintenance Organizations, commercial insurers) also showed the highest percentages in two suburban hospitals: Newton-Wellesley and Melrose-Wakefield. The same source of payment showed the lowest percentages at two urban hospitals (Boston City Hospital in Boston and Providence Hospital in Holyoke) and one suburban hospital (Tobey Hospital in Wareham).**

## **LOW BIRTHWEIGHT BABIES**

The percent of low birthweight babies (less than 2,500 grams or five pounds eight ounces) increased slightly from 5.6% of total births in 1986 to 5.7% (4,846 births). The percent of low birthweight babies born to mothers under the age of 20 decreased from 8.7% to 8.0%.

## **HEALTH OBJECTIVES FOR 1990**

The U.S. Department of Health and Human Services has developed health objectives for 1990 in numerous areas (HEALTHY PEOPLE: Surgeon General's Report on Health Promotion and Disease Prevention; 1979). A good place to assess how Massachusetts is progressing may be measured with data obtained from 1987 birth certificates. For example, there are two objectives on low birthweight infants:

### **1990 OBJECTIVE:**

Low birthweight babies (less than 2,500 grams) should constitute not more than 5% of all live births.

No county or racial/ethnic group of the population should have a rate of low birthweight babies that exceeds 9% of all live births for that population.

### **MASSACHUSETTS--1987:**

4,846 births (or 5.7%) of less than 2,500 grams.

In 1987, every Massachusetts county met the 1990 objective:

<b>COUNTY</b>	<b>PERCENT OF LOW BIRTHWEIGHT BABIES</b>
BARNSTABLE	5.3
BERKSHIRE	6.0
BRISTOL	5.5
DUKES	6.4
ESSEX	5.0
FRANKLIN	4.8
HAMPDEN	6.4
HAMPSHIRE	4.4
MIDDLESEX	4.9
NANTUCKET	2.2
NORFOLK	4.9
PLYMOUTH	5.0
SUFFOLK	9.0
WORCESTER	5.8

There is a continuing problem with the objective by race. For 1987, the percentage of black non-Hispanic infants with a low birthweight was 12.3%:

RACE	PERCENT OF LOW BIRTHWEIGHT BABIES
White non-Hispanic	5.0
Black non-Hispanic	12.3
Hispanic	6.9
Asian	6.4
Other	5.7
Unknown	8.5

#### DEFINITIONS IMPORTANT FOR THIS SECTION INCLUDE:

##### ADEQUACY OF PRENATAL CARE

The Index of Adequacy of Prenatal Care (based on the Kessner Index) is a classification of prenatal care into five categories (adequate, intermediate, inadequate, no prenatal care, and unknown), based upon the trimester in which prenatal care begins and the number of prenatal visits. The general classification scheme is as follows:

CATEGORY	TRIMESTER CARE BEGAN	# OF VISITS
Adequate	1	9 or more
Intermediate	1	5 - 8
	2	5 or more
Inadequate	1	1 - 4
	2	1 - 4
	3	1 or more
No Prenatal Care	-	0
Unknown	unknown	unknown

This classification is adjusted for gestational age to allow for proper classification of premature birth.

##### BIRTHWEIGHT

The weight of an infant or fetus at the time of delivery. It may be recorded in either pounds/ounces or grams. If it is pounds/ounces, it is converted to grams for use in this report.

1 pound = 453.6 grams; 1,000 grams = 2 pounds, 3 ounces

##### BIRTHWEIGHT CATEGORIES

Normal birthweight (NBW): An infant's weight, recorded at birth, of 2,500 grams or more.

Low birthweight (LBW): An infant's weight, recorded at birth, of less than 2,500 grams.

Very low birthweight (VLBW): An infant's weight, recorded at birth, of less than 1,500 grams.

### CAESAREAN SECTION or C-SECTION

Primary: A mother's first occurrence of a Caesarean section delivery.

Repeat: A Caesarean delivery which has been preceded by at least one Caesarean delivery.

### ETHNICITY

See Race.

### INFANT

A child whose age is less than one year (365 days).

### LIVE BIRTH

A live birth is the complete expulsion or extraction from its mother of a product of conception, regardless of the duration of pregnancy, which, after separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

### LOW BIRTHWEIGHT

See Birthweight Categories.

### NEONATE

A child whose age is less than 28 days.

### NORMAL BIRTHWEIGHT

See Birthweight Categories.

### OCCURRENCE BIRTH

A birth occurring in the Commonwealth of Massachusetts, regardless of the residencies of the parents. In Massachusetts, the place will be one of the 351 cities or towns. See Resident Birth.

### PARITY

The number of live births, including the present birth.

### PRIMARY

See Caesarean Section.

### RACE

Race of Infant: For birth data presented in this publication, infant's race is derived from parent's race, according to written recommendation by the National Center for Health Statistics. (Race on a death certificate is determined by the certifier of the death.)

Race of mother: For data presented in this publication, mother's race is as reported by the infant's mother.

Race-ethnicity: Data on race-ethnicity are available starting in June 1986, using the new birth certificate implemented on June 1, 1986. This birth certificate includes separate questions on race and ethnicity of each parent. The categories are then assigned based on a cross classification of the 38 ethnicity and 6 race codes (White, Black, Asian Indian, other Asian, American Indian, and Other). The major impact of this modification is the more precise specification of Hispanic ethnicity, resulting in a decrease in births previously classified as births to white mothers and an increase in Hispanic births.

#### REPEAT

See Caesarean Section.

#### RESIDENT BIRTH

The usual place of residence as reported by the mother. An infant's residence is considered to be that of the mother. In Massachusetts, a resident is a person with a permanent address in one of the 351 cities or towns. Vital statistics data may be presented either in terms of residence or occurrence. Unless otherwise noted, all data in this publication are resident data. Resident data include all events which occur within the state, including those which occur to non-residents. There is an interstate exchange agreement among the 50 states, Canada, Puerto Rico, Guam, the Virgin Islands, and the District of Columbia which provides for exchange of copies of birth and death records. These records are used for statistical purposes only, and allow each state or province to track the births and deaths of its residents.

#### VERY LOW BIRTHWEIGHT

See Birthweight Categories.

#### **RATES IMPORTANT FOR THIS SECTION INCLUDE:**

##### AGE-SPECIFIC BIRTH RATE

No. of Resident Live Births  
for a Specific Age of Mother x 1,000  
Total Female Population  
of That Specific Age

##### CRUDE BIRTH RATE

No. of Resident Live Births x 1,000  
Total Resident Population

##### GENERAL BIRTH RATE

No. of Resident Live Births x 1,000  
Total Female Population of  
Childbearing Age (15-44)

**FIGURE B-1**

**Every day in 1987, residents of Massachusetts experienced an average of:**

**231**

\*Very low birthweight: <1,500 grams.  
Low birthweight: <2,500 grams.

\*\*Calculations based on fewer than 5 events are excluded.

+Calculations are based on births with known adequacy of prenatal care scores.

++Mothers who registered for prenatal care during the first trimester and had nine or more prenatal care visits.

FIGURE B-4

**TRENDS IN ADEQUACY OF PRENATAL CARE <sup>1</sup>**  
**by Maternal Race <sup>2</sup>**  
**Massachusetts: 1980-1987**

1. Calculations are based on births with known adequacy of prenatal care scores.
2. When calculating statistics which include data before June 1986, the race classifications do not include an ethnicity component; most Hispanics are included in the race category of white.

FIGURE B-5

**ADEQUACY OF PRENATAL CARE <sup>1</sup>**  
**by Prenatal Care Source of Payment <sup>1</sup>**  
**Massachusetts: 1987**

1. The source of payment for prenatal care is a self-reported item on the birth certificate. As with all such data, they are subject to the limitations of self-reported information and should be interpreted with the usual caution.
2. Private: Blue Cross/Blue Shield, Commercial Insurers and Health Maintenance Organizations.
3. Public: Medicaid, Medicare, Healthy Start and Other Government.
4. Other: Worker's Compensation and Other.

# TECHNICAL NOTES FOR TABLE B-10 HOSPITAL PROFILES MASSACHUSETTS OCCURRENCE BIRTHS 1987

This table was compiled to provide an overview of the 58 birthing hospitals within the Commonwealth on an individual basis. The figures in the "Occurrence Births" column for each hospital indicate the total number of births that occurred on a hospital-by-hospital basis. Percents shown in this column indicate the percentage of the total Massachusetts births occurring at each hospital.

Each race category within an individual hospital should be regarded as a separate entity. Example: Bay State Medical Center had 5,864 occurrence births in 1987. Of these, 72.2% were to white, non-Hispanic women, 11.8% were to black, non-Hispanic women, 14.1% were to Hispanic women, and so forth. When considering methods of delivery at Bay State Medical Center, of the 72.2% of births to white, non-Hispanic mothers, 27.2% of these babies were delivered by Caesarean Section (706 primary C-Section deliveries and 443 repeat C-Section deliveries).

The percent of low birthweight (less than 2,500 grams) babies born to white, non-Hispanic mothers was 7.2%, while 78.5% of white, non-Hispanic mothers at Bay State Medical Center received adequate prenatal care. The adequacy of prenatal care is based on two factors: the month a woman registers for prenatal care and the total number of visits for prenatal care. Please refer to the definitions at the beginning of this section for further explanation.

## Additional Notes:

\*\*Calculations based on 15 or fewer Caesarean-section births per race category are indicated by "\*\*\*\*" in the three Method of Delivery columns.

\*\*Calculations based on fewer than 10 births per race category are indicated by "\*\*\*\*" across the entire row. In these cases, only the percent of births by race of mother is shown.

\*\*Percents may not sum to 100.0 due to rounding.

\*\*Zero events are indicated by dashes.

# MORTALITY

## SECTION C

### MORTALITY

Resident deaths decreased by 0.5% in Massachusetts from 55,860 in 1986 to 55,562 in 1987. The rate of deaths per 1,000 population also decreased from 9.6 in 1986 to 9.5 in 1987. As with live births, deaths to Massachusetts residents include all deaths to Massachusetts residents regardless of the state in which they occurred. Most data presented in this section are residence data. Occurrence data are used only with medical examiner data.

#### DEATHS BY RACE

The number of deaths by race remained relatively constant, with white residents comprising 96.3% of total deaths in Massachusetts.

Race data provided through death certificates vary considerably from that provided on birth certificates. On birth certificates, race is provided as part of the confidential, statistical portion of the record. As such, there is a significant problem with non-respondents. On the death certificate, however, race information (as is all information on the death certificate) is part of the legal record and must be provided by the funeral director in order to register the death. An unknown or non-response in the race item might be the result of a case in which a body is badly decomposed, rather than a refusal to provide the information.

As with birth certificate data, there is a problem identifying those deaths to individuals of Hispanic ethnicity. The question as asked on the 1986 death certificate was limited to a race question and, in many cases, individuals with an Hispanic ethnicity were identified using a race designation, for example, white or black, rather than a response of Hispanic. If the response was Hispanic, however, these deaths are included in the larger category of "white". Race information on the death certificate is provided by the informant, which in most cases is a close relative. Beginning on January 1, 1989, an additional item on Hispanic origin was added to the death record.

#### DEATHS BY AGE

Persons 75 years of age or older accounted for 53.7% of deaths. The percent of deaths to residents in this age group vary widely by race and sex.

SEX	RACE	% OF DEATHS UNDER AGE 75	% OF DEATHS 75 YEARS AND OLDER
MALE	WHITE	57.0	43.0
	BLACK	77.0	23.0
	TOTAL	57.9	42.1
FEMALE	WHITE	34.5	65.5
	BLACK	61.9	38.1
	TOTAL	35.4	64.6
TOTAL	WHITE	45.4	54.6
	BLACK	70.0	30.0
	TOTAL	46.3	53.7

## DEATHS BY PLACE OF OCCURRENCE

Between 1986 and 1987, there was little variation in where deaths occurred, as shown in the data presented below:

SITE	% OF DEATHS	% OF DEATHS
	1987	1986
HOSPITAL	61.8	62.3
AT HOME	15.3	14.7
NURSING OR REST HOME	15.6	15.4
EN ROUTE TO HOSPITAL OR DEAD ON ARRIVAL	6.2	6.6
OTHER AND UNKNOWN	<u>1.0</u>	<u>1.0</u>
TOTAL	100.0*	100.0

\*Percent does not sum to 100.0 due to rounding.

## DEATHS BY CAUSE

Cause of death statistics in this report are based on the Ninth Revision of the International Classification of Diseases (ICD-9). The methodology of coding cause of death from death certificates is consistent nationally, using the Automated Classification of Medical Entities (ACME), developed by the National Center for Health Statistics (NCHS). The ACME system requires every disease or condition mentioned on the record to be coded. The underlying cause is then selected by a computer program which incorporates the ICD-9 rules and conventions. Cause of death information in this report is based on underlying cause, except where otherwise noted.

Three tables (C-5, C-6, and C-10) present data based on multiple conditions rather than underlying cause data. These tables are presented to illustrate the use of multiple cause data by extending the utility of mortality data. This is particularly true when utilizing mortality data as a method of surveillance. For example, in 1987 there were 13,265 deaths resulting from cancer as an underlying cause of death. However, an additional 2,334 deaths where cancer was not the underlying cause did include cancer as a mentioned condition, increasing the surveillance data base.

Table C-10 demonstrates the ability of multiple cause data to enhance the function of mortality data as a morbidity tool in cases of diseases that are not traditional underlying causes of death. In the case of diabetes, for example, 848 deaths had this condition listed as an underlying cause, but an additional 3,455 had diabetes listed as a mentioned condition, thus increasing the ability to determine the prevalence of diabetes in the population.

The leading causes of death differ by race. Among white and non-white Massachusetts residents, heart disease and cancer rank as the first two leading causes. As in 1986, cerebrovascular disease continues to be the third highest ranking cause of death for non-white residents. However, in 1987, diseases of the respiratory system rank as the third leading cause of death for white Massachusetts residents, while ranking as the fourth leading cause for non-white residents. Perinatal mortality ranks fifth among the leading causes for non-white residents, but is not among the five leading causes for white Massachusetts residents.

CAUSE	WHITE	RANK	NON-WHITE	RANK
HEART DISEASE	19,560 36.5%	1	545 26.7%	1
MALIGNANT NEOPLASMS	12,827 24.0%	2	438 21.5%	2
DISEASES OF RESPIRATORY SYSTEM	4,991 9.3%	3	121 5.9%	4
CEREBROVASCULAR DISEASE	3,649 6.8%	4	128 6.3%	3
PNEUMONIA & INFLUENZA	2,406 4.5%	5	NOT LEADING CAUSE	
PERINATAL MORTALITY	NOT LEADING CAUSE		77 3.8%	5
ALL OTHER CAUSES*	10,089 18.9%	-	729 35.8%	-

\*All Other Causes includes diabetes mellitus, chronic liver disease and cirrhosis, atherosclerosis, suicide, intentional and unintentional injuries, and all other causes not specifically mentioned above.

#### ACQUIRED IMMUNE DEFICIENCY SYNDROME (AIDS)

The Ninth Revision of the International Classification of Diseases was developed before the identification of AIDS. Classification of this disease and related diseases has evolved since 1981. The deaths presented in Table C-9 were coded by using the most current schedule, which began with 1987 data. Therefore, comparison data from previous years are not available. As time passes and more becomes known about AIDS, additional limitations to the coding schedule will also become known.

#### DEATHS CERTIFIED BY MEDICAL EXAMINERS

The total number of deaths certified by medical examiners decreased from 10,945 in 1986 to 10,235 in 1987. Of the deaths certified by medical examiners, 75.2% were reported as a result of nonviolent causes. The percentage of nonviolent deaths certified by medical examiners varies widely by county, from a high of 82.6% in Plymouth County to a low of 56.7% in Worcester County. Suffolk County had the greatest number of deaths (1,749) that were referred to medical examiners but with the certification retained by the attending physician.

## 1990 HEALTH OBJECTIVES

Presented below is an assessment of Massachusetts compared to the 1990 health objectives using 1987 mortality data.

### 1990 OBJECTIVE:

#### Maternal Mortality:

Maternal mortality rate should not exceed 5 per 100,000 live births for any county or ethnic group.

#### Drowning:

Deaths from drowning should be reduced to no more than 1.5 per 100,000 persons.

#### Falls:

Deaths due to falls should be no more than 2 per 100,000 persons.

#### Motor Vehicle Deaths:

Motor vehicle death rate for children under the age of 15 should be no more than 5.5 per 100,000 children.

Overall motor vehicle death rate should not exceed 18 per 100,000 population.

Fatalities from alcohol-related motor vehicle accidents should be less than 9.5 per 100,000 population.

#### Fires:

National Objective: No more than 4,500 residential fire deaths nationwide.

### MASSACHUSETTS--1987:

There were 3 cases of maternal mortality in 1987, resulting in a rate of 3.6.

There were 69 deaths from drowning in 1987, resulting in a rate of 1.2 per 100,000 population.

In 1987, there were 344 deaths for a rate of 5.9 per 100,000 population.

The 1987 rate was 4.2 with 48 deaths.

The rate in 1987 was 12.7, already below the 1990 objective.

In data supplied by the Registry of Motor Vehicles, the number of alcohol-related deaths was given as 272 or 4.6 per 100,000 population.

Massachusetts Objective: No more than 60 residential fire deaths per year.

MASSACHUSETTS--1987:  
There were 61 residential fire deaths in 1987.

#### Drugs:

Drug related mortalities should not exceed 2 per 100,000 population yearly.

The 1987 death rate was 0.9 with 51 deaths.

However, recent studies have shown that chemical substances such as drugs and alcohol are underreported as a cause of mortality. This rate may be impacted by this underreporting.

#### Cirrhosis:

The death rate from cirrhosis should not exceed 12 per 100,000.

The 1987 rate was 13.2 per 100,000 population.

### DEFINITIONS IMPORTANT FOR THIS SECTION INCLUDE:

#### AGE-ADJUSTED RATE

A procedure for adjusting rates, designed to minimize the effects of differences in age distribution when comparing rates for different populations. This procedure is accomplished by the computational process known as age standardization, whereby mortality statistics are adjusted to a reference population. For this publication, the reference population is the 1940 U.S. population, the same as used by the National Center for Health Statistics. The results of the process is a summary index that can be used to compare rates of different populations throughout the nation and over time.

#### CAUSE OF DEATH

The underlying condition which gives rise to a series of events leading to death. The code used for identifying cause of death is the Ninth Revision of the International Classification of Diseases. The underlying cause of death is generated by a computer software program developed by the National Center for Health Statistics from coding all causes on death certificates.

#### DEATH CERTIFICATE

A vital record signed by a licensed physician that includes cause of death, decedent's name, sex, birth date, place of residence, and place of occurrence.

#### INTERNATIONAL CLASSIFICATION OF DISEASES, NINTH REVISION

The International Classification of Disease (ICD) classifies mortality information for statistical purposes. The ICD was first used in 1900 and has since been revised about every 10 years. The Ninth Revision, published in 1977, is used to code mortality data beginning with 1979.

#### MISER

The Massachusetts Institute for Social and Economic Research. This research institute, located at the University of Massachusetts in Amherst, produces the population estimates and projections used officially by the Massachusetts Department of Public Health.

#### OCCURRENCE DEATH

Occurrence death includes all deaths that occur within the state, including deaths that occur to non-residents. An interstate exchange agreement among the 50 states, Canada, Puerto Rico, Guam, the Virgin

Islands, and the District of Columbia provides for exchanges of copies of birth and death records. These records are used for statistical purposes only, and allow each state or province to track the births and deaths of its residents.

#### RACE

For death records: the response of the death record informant, for example, spouse or next of kin.

#### RESIDENT DEATH

The usual place of residence as reported by the informant. In Massachusetts, a resident is a person with a permanent address in one of the 351 cities or towns. Unless otherwise noted, all data in this publication are resident data. Resident deaths include all deaths that occur to residents of the Commonwealth, wherever they occur. An interstate exchange agreement among the 50 states, Canada, Puerto Rico, Guam, the Virgin Islands, and the District of Columbia provides for exchanges of copies of birth and death records. These records are used for statistical purposes only, and allow each state or province to track the births and deaths of its residents.

#### UNDERLYING CAUSE OF DEATH

The underlying cause of death is: 1.) the disease or injury that initiated the series of events leading to death, or 2.) the circumstances of the unintentional or intentional injury that resulted in the death. See Death Certificate.

#### **RATES IMPORTANT FOR THIS SECTION INCLUDE:**

##### AGE-SPECIFIC DEATH RATE

$$\frac{\text{Number of Resident Deaths in Specific Age Group}}{\text{Total Population of Specific Age Group}} \times 100,000$$

##### CAUSE-SPECIFIC DEATH RATE

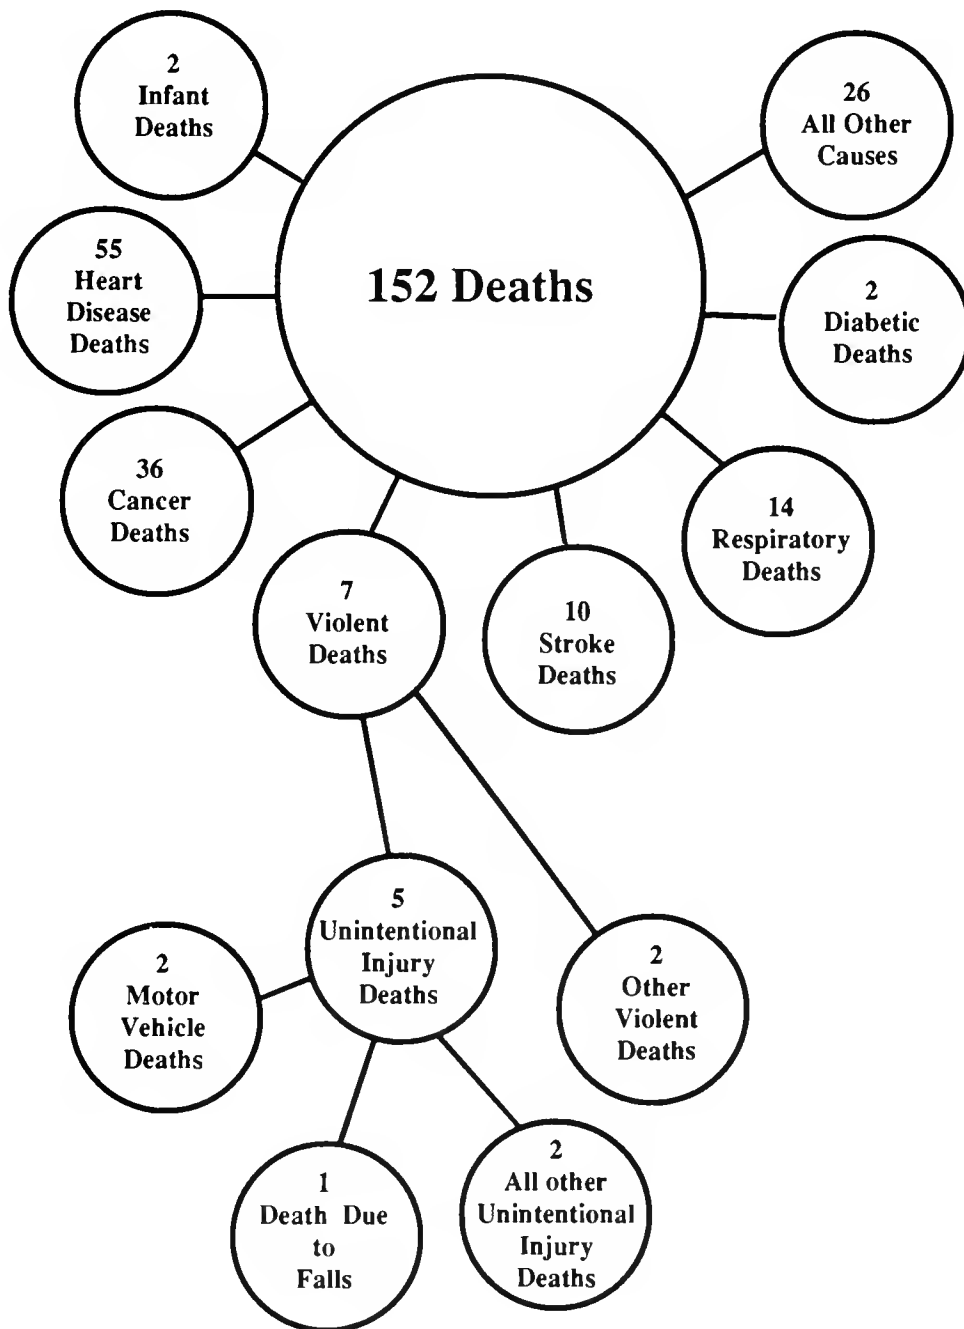

$$\frac{\text{Number of Resident Deaths for a Specific Cause}}{\text{Total Population}} \times 100,000$$

##### CRUDE DEATH RATE

$$\frac{\text{Number of Resident Deaths In A Year}}{\text{Total Population}} \times 1,000$$

**FIGURE C - 1**

**Every day in 1987, residents of Massachusetts experienced an average of:**

\*Provisional United States data from the National Center for Health Statistics based on a 10 percent sample of deaths. Rates per 100,000 population in specified group.

TABLE C-3  
LEADING UNDERLYING CAUSES OF DEATH BY AGE  
MASSACHUSETTS, RESIDENTS  
1987

Deaths	Underlying Cause	ICD-9
Number	< 1 year old*	
329	Certain conditions originating in the perinatal period	760-779
125	Congenital anomalies	740-759
57	Sudden infant death syndrome	798.0
1 - 4 years old		
19	Congenital anomalies	740-759
15	Vehicle-related injuries, excluding motor vehicle	E800-E807, E826-E849
9	Major cardiovascular diseases	390-448
7	Malignant neoplasms	140-208
6	Infectious & parasitic diseases, excluding TB, polio & syphilis	001-009, 020-041, 045-088, 098-139
5 - 14 years old		
41	Motor vehicle-related injuries	E810-E825
23	Vehicle-related injuries, excluding motor vehicle	E800-E807, E826-E849
11	Malignant neoplasms of the bone, skin, oral cavity, rare sites & other	140-149, 170-173, 190-203
9	Leukemia	204-208
9	Major cardiovascular diseases	390-448
15 - 24 years old		
250	Motor vehicle-related injuries	E810-E825
105	Suicide	E950-E959
72	Vehicle-related injuries, excluding motor vehicle	E800-E807, E826-E849
48	Homicide and legal intervention	E960-E978
42	Malignant neoplasms	140-208
25 - 44 years old		
462	Malignant neoplasms	140-208
425	Major cardiovascular diseases	390-448
243	Suicide	E950-E959
220	Motor vehicle-related injuries	E810-E825
183	AIDS and HIV-related diseases	042-044
45 - 64 years old		
2,108	Ischemic heart disease	410-414
1,106	Malignant neoplasms of respiratory & intrathoracic organs	160-165
783	Malignant neoplasms of digestive organs & peritoneum	150-159
715	Malignant neoplasms of the bone, skin, oral cavity, rare sites & other	140-149, 170-173, 190-203
706	Diseases of pulmonary circulation & other forms of heart disease	415-429
65 - 74 years old		
3,304	Ischemic heart disease	410-414
1,209	Malignant neoplasms of respiratory & intrathoracic organs	160-165
1,162	Diseases of pulmonary circulation & other forms of heart disease	415-429
1,067	Malignant neoplasms of digestive organs & peritoneum	150-159
790	Malignant neoplasms of the bone, skin, oral cavity, rare sites & other	140-149, 170-173, 190-203
75 - 84 years old		
4,547	Ischemic heart disease	410-414
1,571	Diseases of pulmonary circulation & other forms of heart disease	415-429
1,288	Cerebrovascular disease	430-438
1,071	Malignant neoplasms of digestive organs & peritoneum	150-159
794	Malignant neoplasms of respiratory & intrathoracic organs	160-165
85+ years old		
3,973	Ischemic heart disease	410-414
1,735	Diseases of pulmonary circulation & other forms of heart disease	415-429
1,490	Cerebrovascular disease	430-438
1,170	Pneumonia and influenza	480-487
537	Malignant neoplasms of digestive organs and peritoneum	150-159

\*More complete information on causes of infant death is found in Table D-4.

# **NEONATAL AND INFANT MORTALITY**

## SECTION D

### NEONATAL AND INFANT DEATHS

Resident infant deaths (deaths less than 1 year of age) decreased by 12.5% in Massachusetts from 695 in 1986 to 608 in 1987. The rate of infant deaths also decreased from 8.4 per 1,000 live births in 1986 to 7.2 in 1987. As with live births and deaths, all Massachusetts resident infant deaths are included regardless of the state in which they occurred. Neonatal deaths (deaths under 28 days of age) also decreased, from 478 in 1986 to 432 in 1987, a decrease of 9.6%. The rate of neonatal deaths per 1,000 live births showed a decrease from 5.8 in 1986 to 5.1 in 1987.

#### INFANT DEATHS BY RACE

In 1987, the white infant mortality rate was 6.6, a decrease from the 1986 rate of 7.6. The black infant mortality rate was 15.5, reflecting a decrease from the 1986 rate of 19.7. The neonatal mortality rate for white infants was 4.6 deaths per 1,000 live births, and the neonatal mortality rate for black infants was 11.2 per 1,000 live births.

The decrease in infant deaths in 1987 occurred within both the white and black populations.

#### INFANT DEATHS BY AGE

Of all infant deaths, 46.9% occurred within the first 24 hours and 61.2% within the first week of life.

#### INFANT DEATHS BY CAUSE

The leading cause of infant deaths did not vary from 1986 to 1987. The major cause of death was certain conditions originating in the perinatal period (medical conditions arising from approximately 28 weeks gestation to 28 days of age). These deaths accounted for 54.1% of all infant deaths. The second leading cause of infant deaths was congenital anomalies, which accounted for 20.6% of infant deaths.

#### NEONATAL MORTALITY BY BIRTHWEIGHT

Neonatal mortality is highly correlated to low birthweight. Low birthweight babies (under 2,500 grams or 5 pounds, 8 ounces) accounted for 5.7% of all babies born in Massachusetts in 1987.

#### HEALTH OBJECTIVES FOR 1990

The U.S. Department of Health and Human Services has developed health objectives for 1990 in numerous areas (HEALTHY PEOPLE: Surgeon General's Report on Health Promotion and Disease Prevention; 1979). Presented below is an assessment of Massachusetts compared to the 1990 objectives using 1987 infant and neonatal mortality data.

##### 1990 OBJECTIVE:

Infant mortality rate should not exceed nine deaths per 1,000 live births.

Neonatal mortality rate should not exceed 6.5 deaths per 1,000 live births.

##### MASSACHUSETTS--1987:

There were 7.2 deaths per 1,000 live births.

In 1987, the Massachusetts rate was 5.1 per 1,000 live births.

No racial or ethnic group of the population should have an infant mortality rate in excess of 12 deaths per 1,000 live births.

In 1987, the white infant mortality rate was 6.6, and the black infant mortality rate was 15.5.

#### **DEFINITIONS IMPORTANT FOR THIS SECTION INCLUDE:**

##### **INFANT DEATH**

Death of a child whose age is less than one year (365 days).

##### **NEONATAL DEATH**

Death of a child whose age is less than 28 days.

##### **FETAL DEATH**

A fetal death is a death prior to the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy; the death is indicated by the fact that after such separation the fetus does not breath or show any other evidence of life, such as the beating of the heart, pulsation of the umbilical cord, or definite movement of the voluntary muscles.

Massachusetts law requires that fetal deaths of 20 or more weeks gestation or of a weight of at least 350 grams be reported; therefore, the fetal deaths referred to in this report are of that gestational age or weight.

#### **RATES IMPORTANT FOR THIS SECTION INCLUDE:**

##### **INFANT MORTALITY RATE**

$$\frac{\text{Number of Resident Deaths at Less than 1 Year of Age}}{\text{Total Resident Live Births}} \times 1,000$$

##### **NEONATAL MORTALITY RATE**

$$\frac{\text{Number of Resident Deaths at Less Than 28 Days of Age}}{\text{Total Resident Live Births}} \times 1,000$$

\* The figures used in this table cannot be directly compared with other tables in this report. Neonatal mortality statistics by birthweight include deaths to infants less than 28 days old who were born to residents of Massachusetts. Deaths occurring in January of the subsequent year are included if the birth occurred in December of the data year. Deaths occurring in January of the data year are not included if the birth occurred in December of the previous year. Denominators are resident births of the data year.

Due to major changes in the birth certificate computer file in 1987, the linked neonatal death and birth tape is not yet available.

"--" Indicates zero events.

\*Total includes two births of unknown sex. In calculating the infant mortality rate by race, births of unknown race have been allocated to white, black, and other based on their percents of total births with reported race.

# MARRIAGES AND DIVORCES

## SECTION E

### MARRIAGES AND DIVORCES

Marriages and divorces are reported by place of occurrence in Massachusetts. For example, if two Springfield residents are married in Boston, this marriage will be reported by place of occurrence (Boston) rather than residence of the couple (Springfield). Marriages have traditionally been reported in this manner because of the number of couples who live in different communities.

Marriages and divorces which involve Massachusetts residents, but occur in other states, are not included in these figures. No system of interstate exchange exists for these events. Unlike some states, Massachusetts marriage and divorce laws neither encourage out-of-state residents to come to the state nor discourage residents from using the Massachusetts system by imposing long waiting periods, etc. This allows the marriage data to be used to estimate resident marriages.

In 1987, 49,034 marriages occurred in Massachusetts, compared to 49,990 in 1986, a decrease of 1.9%. The rate of marriages was 8.4 per 1,000 population in 1987, a slight decrease from the 1986 rate of 8.6. The U.S. rate of marriages per 1,000 population decreased from 10.0 per 1,000 population in 1986 to 9.9 in 1987. Of the brides, 74.8% had never previously been married. This percentage was slightly less among the grooms--73.1%.

In 1987, 16,994 divorces were granted in Massachusetts, a decrease of 14.2% from the 19,809 divorces granted in 1986. The 1987 rate of divorce per 1,000 population in Massachusetts was 2.9. This was well below the 1987 U.S. rate of 4.8 divorces per 1,000 population, which decreased from the 1986 U.S. rate of 4.9 divorces per 1,000 population.

#### DEFINITIONS AND RATES IMPORTANT FOR THIS SECTION INCLUDE:

MARRIAGE RATE  $\frac{\text{Number of Occurrence Marriages}}{\text{Total Population}} \times 1,000$

DIVORCE RATE  $\frac{\text{Number of Occurrence Divorces}}{\text{Total Population}} \times 1,000$

TABLE E-1

# POPULATION

## **SECTION F**

### **POPULATION**

The population data in this section are presented for use in computing rates for small areas and for reporting changes over time by municipality, county, and health service areas. They are based primarily on the federal census for decennial years, e.g., 1980, and on the Commonwealth census for intercensal years, e.g., 1975, and on the Massachusetts Institute for Social and Economic Research (MISER) estimates for 1985 (see Table F-2).

Prior to 1985, the Massachusetts State Census method of enumeration differed from the federal census. Generally, the state figures excluded non-resident students and military families residing in the Commonwealth; they are included in the U.S. census definition of resident.

The Massachusetts population estimates for 1980-1987 (Table F-4) are interpolations based on the 1980 federal census and the 1990 population projections provided by MISER.

33 I HEREBY CERTIFY that this delivery occurred on the date stated and product of conception was not a live birth.							
34 Signature of Attending Physician or Medical Examiner						35 TITLE	
34						35	

### DEFINITION:

"Fetal death" per chapter 111 section 202 of the M.G.L. means death prior to the complete expulsion or extraction from its mother of a fetus, irrespective of the duration of pregnancy, as indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. A fetal death does NOT include an induced abortion as defined in section 12K of chapter 112 of M.G.L. Spontaneous abortions are to be included.

### TO BE REPORTED:

Only fetal deaths of twenty weeks or more gestation or of a weight of 350 grams or more are to be reported.

### INSTRUCTIONS:

Return completed report within 10 days to the Registry of Vital Records and Statistics, Room B-3, 150 Tremont Street, Boston, MA 02111
